problems of our time employment inequality the environment and quality of life these exciting new volumes are the first of their kind in which these problems are analyzed using a unified theory framework

this volume contains twenty two original contributions by leading scientists in many important areas of probability theory and its applications the material also includes significant new results together this collection of papers provides a good state of the art survey of current research in the following areas inequalities limit theorems renewal theory and reliability theory characterizations of distributions infinite divisibility of polynomials of normal variables limiting distributions for order statistics stochastic processes functional equations in engineering model building and probabilistic number theory

great advances have been made in recent years in the field of computational probability in particular the state of the art as it relates to queuing systems stochastic petri nets and systems dealing with reliability has benefited significantly from these advances the objective of this book is to make these topics accessible to researchers graduate students and practitioners great care was taken to make the exposition as clear as possible every line in the book has been evaluated and changes have been made whenever it was felt that the initial exposition was not clear enough for the intended readership the work of major research scholars in this field comprises the individual chapters of computational probability the first chapter describes in nonmathematical terms the challenges in computational probability chapter 2 describes the methodologies available for obtaining the transition matrices for markov chains with particular emphasis on stochastic petri nets chapter 3 discusses how to find transient probabilities and transient rewards for these markov chains the next two chapters indicate how to find steady state probabilities for markov chains with a finite number of states both direct and iterative methods are described in chapter 4 details of these methods are given in chapter 5 chapters 6 and 7 deal with infinite state markov chains which occur frequently in queueing because there are times one does not want to set a bound for all queues chapter 8 deals with transforms in particular laplace transforms the work of ward whitt and his collaborators who have recently developed a number of numerical methods for laplace transform inversions is emphasized in this chapter finally if one wants to optimize a system one way to do the optimization is through markov decision making described in chapter 9 markov modeling has found applications in many areas three of which are described in detail chapter 10 analyzes discrete time queues chapter 11 describes networks of queues and chapter 12 deals with reliability theory

theoretical physicist nicolescu cnrs and u of paris france employs a view of the universe found in quantum physics to build his argument as to how basic spiritual questions may be answered and the problems of humanity such as greed and the dichotomy between rich and poor can be overcome his method is called transdisciplinarity because it requires a way of thinking that rises above and beyond the methods of individual disciplines seeing multiple levels of meaning rather than simple dichotomies annotation copyrighted by book news inc portland or
